

Smile Craft Mobile

Milestone 3 — Delivery Summary

Project: Smile Craft mobile app **Platforms:** iOS & Android

Milestone: M3 — Patient Records, Appointment Actions & Profile **Status:** **Delivered**

1. What this milestone covers

Milestone 3 turns the app from a read-only schedule viewer into a working clinic tool. Clinic staff can now register new patients, cancel and reschedule appointments from a tap-and-act popover on the calendar, manage their account from a proper profile screen, and review a live notifications feed of everything happening in the clinic.

2. Features delivered

2.1 Patient Registration Live

- **New-patient form** on the Register tab with first name, last name, father's name, date of birth, phone, gender, assigned doctor, email, and allergies/notes.
- **Built-in validation:** required-field checks, date-of-birth is auto-masked to `DD-MM-YYYY` and rejected if not a real past date, phone is digits-only, email is checked for the right format.
- **Duplicate detection:** if the phone is already registered to another patient, the app surfaces a confirm dialog showing the existing patient's name and gives the user the choice to continue anyway or cancel.
- **Role-aware doctor selection:** non-owner doctors can only register patients under their own name (the field is locked); owners, assistants, and admins pick from a doctor list.
- Wired to the existing `POST /register-patient` backend; gender list pulled live from `GET /getGender`.

2.2 Calendar Appointment Popover Live

Tapping a booked appointment on the Day or Week view opens a popover modal with patient name, status, time range, treatment, and doctor.

- **Cancel appointment** — reason picker (loaded live from `GET /cancellation-reasons`), submits to `POST /cancel-appt`, and the calendar updates immediately when the server confirms.
- **Edit / Reschedule** — opens a full-screen edit form pre-filled with the appointment's current date, start & end time, doctor, treatment, and a WhatsApp-reminder toggle. Saves through `POST /encounter` (the backend's update path).
- **Confirm appointment** — shown as a placeholder action. Needs a small backend addition (see Section 4) before it can be wired.
- **Charge / Take payment** — shown as a placeholder. Ships with the Billing module in M4 (the backend endpoint, `/treatment-plan`, handles both the encounter recording and the billing in one call).
- Already-cancelled appointments show the Cancel action greyed out with explanatory helper text.

2.3 Edit / Reschedule Appointment Live

- Modal-style screen reached from the appointment popover's "Edit / Reschedule" action.
- Editable: **date** (DD-MM-YYYY mask), **start & end time** (HH:MM mask), **doctor** (picker), **treatment**, and a **WhatsApp-reminder** toggle.
- End time must be after start time; date and time fields are validated as the user types.
- Patient identity (name, family, DOB, phone) is carried over from the selected appointment so the backend's patient lookup matches.
- On save, the calendar and dashboard refresh automatically to show the new schedule.

2.4 Profile & Settings Live

- New **profile** screen reached from the avatar button in the Dashboard header (replaces the interim Logout button that was sitting on the dashboard since M2).
- **User card** with avatar (auto-initials), name, role (pretty-printed: "Owner Doctor", "Assistant", etc.), and email.
- **Preferences** section with Language and Push Notifications listed as roadmap items (push needs a backend update — see Section 4).
- **About** section with the app version, build number, and clinic ID.
- **Log out** button with a confirmation dialog before signing out.

2.5 Notifications Inbox Live

- New **Notifications** screen reached from the bell button on the Dashboard.
- Captures every appointment and patient change that arrives in real time over the existing socket connection (new bookings, updates, confirmations, cancellations, deletions, patient registrations, edits, removals).
- Each entry has a kind-aware icon and tint, the headline of what changed, who it relates to, and a relative timestamp ("Just now", "5m ago", "3h ago", etc.).
- The Dashboard bell shows a **red dot** as long as there are unread notifications.
- **Mark all as read** and **Clear all** actions; the inbox keeps the 100 most recent items.
- This is a client-side feed; a server-backed inbox would land later if the team wants notifications to persist across devices or app reinstalls.

3. Technical notes

- All M3 screens are **fully wired to the existing live backend** — no new backend services were stood up. The mobile app uses the same APIs the web app already uses.
- Demo mode (which the QA tester uses by default) returns realistic fake responses so every flow can be exercised without hitting the live system. Switching from demo to live is a one-line flag.
- Forms use **React Hook Form + Zod** (same stack as the M2 login and forgot-password forms) for consistent validation and a single way to maintain forms going forward.
- The doctor picker added in the M2 polish round is reused throughout M3 — same selection control on Calendar, Dashboard, Registration, and Edit screens.

4. Backend updates needed for the next milestone

Two small backend additions would close the placeholders shown in M3:

- **Manual confirm appointment endpoint** — today the only way an appointment moves to "confirmed" is through the WhatsApp webhook (patient taps Confirm in WhatsApp). The mobile app needs:

```
POST /confirm-appt { bookingId } → sets patient_confirmed = True and emits confirmedAppointment on the same rooms the existing flow uses.
```

- **Push notification device-token registration** — needed before iOS/Android push notifications can be turned on:

```
POST /register-device-token { token, platform } → stores per-user, then the existing socket emits should call a Celery task that pushes to those tokens via FCM / APNs.
```

5. What sits outside M3

Module	Where it lands	Why
Encounter recording (in-visit treatment, tooth numbers, notes, attachments)	M4, alongside Billing	The backend endpoint that records a clinical encounter, <code>/treatment-plan</code> , also handles billing, payments, and outstanding balances in one call. Splitting them in the mobile UI would mean two competing flows for the same endpoint, so they ship together.
Confirm appointment	Wired as soon as the backend endpoint above is added	UI is already in place in the popover — it just needs the endpoint.
Push notifications	Once the device-token endpoint exists	Mobile-side device-token registration + Expo push handler will be a small follow-up build.
Per-procedure colour list (carried over from M2 polish)	Next build, once the clinic confirms the colour mapping	Blocked on the procedure → colour list we asked for.

6. What's coming next (M4 preview)

- **Cashier & Billing** — pending bills, payments, outstanding balances, bill receipts. Wires the "Charge / Take payment" action in the calendar popover.
- **Encounter recording** — record what happened during a visit (procedures, tooth numbers, notes, status changes), backed by `/treatment-plan` .
- **Confirm appointment** — wired the moment the backend endpoint lands.
- **Push notifications** — same.

Smile Craft Mobile — Milestone 3 Delivery Summary. Prepared for client review.
